

Oracle Fusion AI Agents Foundations

Monday, February 2, 2026 8:02 AM

Introduction

Use case: Company like Dell receives an Order

Goal: Entire Process should be automated E2E

AI Agents:

Check Inventory : SCM Agent

Contact Supplier : Procurement Agent

Validate Credit: Finance Agent

Plan Shipment: Logistics Agent

AI Agent Teams (Multiple Agents Collaborate) - **Digital Workforce**

Oracle Fusion AI Insights

Descriptive Analytics, Diagnostics Analytics, Predictive Analytics, Prescriptive Analytics

Oracle Fusion AI + Agent Studio + LLM (GPT+GEMINI) - licensing model

3 Layers of Oracle Fusion AI Agentic System:

Fusion SAAS License (base)

AI Agent Studio(design layer) - Standard Usage + Custom AI Agent Subscription Per user/per agent pricing model

OCI Gen AI/LLM (Consumption layer)

Token-based Pricing (Multi-LLM Ecosystem), OCI Generative AI Agents Pricing, Compute-Based

Pricing (Dedicated Models. Custom Models) - GPU/Hour - Compute

Custom Models - Fine Tune Models according to Enterprise Data , Adapted , Your domain knowledge like Finance Rules, SCM Workflows

AI = Decision Making

Traditional AI helps:

- Predict
- Classify
- Analyze

GenAI = Content + Reasoning

GenAI introduced:

- Natural language interaction
- Context understanding
- Content generation

Agents = Action + Automation

This is the BIG SHIFT

Agents don't just respond they:

- Think
- Decide
- Act

Example:

Instead of telling you “**Inventory is low**”

Agent will:

- Check suppliers
- Trigger procurement
- Notify stakeholders

That's why we call this:

Agentic AI = Autonomous Enterprise Systems

Oracle is embedding **AI natively inside Fusion apps**.

Oracle AI can help improve **productivity** and **decision-making**, **automate end-to-end business processes**, and reduce the **cost of doing business**.

Focus Areas of Oracle AI for Fusion Applications

An **AI Agent** is a system that:

1. Receives input
2. Thinks (reasons using a model like Gemini)
3. Uses tools if needed
4. Produces output
5. Learns from interaction

Unlike normal LLM prompts, agents:

- Maintain memory
- Use tools
- Perform multi-step reasoning
- Act autonomously

Claude

AI Agent Architecture

Think of an AI agent like a **smart employee**:

Topic	Real-world meaning
Reasoning	Thinking
Goals	Assigned work
Workflow	Process followed
Tools	Software used

Knowledge	Experience/data
Prompts	Instructions from manager
Security	Company rules
Monitoring	Performance review

Oracle AI Agent Architecture

Architecture = **Data+Intelligence+Decision+Action+Learning**
